What Are Geological Structures?

Geological structures refer to the features formed within rocks as a result of geological processes such as tectonic forces, sediment deposition, erosion, and volcanic activity. These structures provide insights into the history of the Earth's crust, tectonic movements, and seismic activities.

Types of Geological Structures

Geological structures can be broadly categorized based on their formation mechanisms and resultant features:

1. **Folds:** Bends or curves in rock layers caused by compressional forces. Examples include anticlines (upward-arching folds) and synclines (downward-sinking folds).
2. **Faults:** Fractures along which rocks have moved relative to each other. Fault types include strike-slip, normal, and reverse faults.
3. **Joints:** fractures without significant movement, often serving as zones of weakness in rocks.
