Introduction to Lens Design with Practical Zemax

Examples Lens design is a fundamental aspect of optical engineering that encompasses the creation of lenses and optical systems to meet specific imaging and illumination objectives. It involves understanding optical principles, material properties, and manufacturing constraints to develop solutions that effectively manipulate light. As technological demands increase—ranging from high-resolution cameras and microscopes to laser systems and virtual reality devices—so does the complexity of designing efficient, high-performance lenses. Modern lens design heavily relies on advanced software tools for simulation, optimization, and validation, with Zemax OpticStudio being one of the most widely used platforms in the industry. This article aims to introduce the key concepts of lens design through practical examples using Zemax, enabling readers to develop foundational skills and apply them effectively.

Understanding the Fundamentals of Lens Design

Basic Concepts and Terminology

Before diving into practical Zemax examples, it is essential to grasp fundamental concepts:

- Optical Axis:** The central line passing through the centers of curvature of lens surfaces.
- Focal Length:** The distance from the lens to the focal point; determines the magnification and field of view.
- Aperture:** The opening that limits the amount of light reaching the imaging sensor or eye.
- Field of View (FOV):** The extent of the observable world seen through the lens.
- Aberrations:** Imperfections causing image distortions, such as spherical aberration, coma, chromatic aberration, and astigmatism.
- Design Types:** Includes simple single-element lenses, compound lenses, and multi-element optical systems.

The Role of Optical Materials

Material selection influences the lens's optical performance, cost, and manufacturability. Common materials include:

- BK7:** A common crown glass with good transmission in visible spectrum.
- Fused Silica:** Offers high transmission in UV and IR.
- Specialty Glasses:** Designed to correct specific aberrations or achieve certain dispersion properties.

Choosing materials involves considering refractive index,

Abbe number, dispersion, and manufacturing constraints.

aberration. Improved color fidelity. Practical tips: Use the

Spot Size and Wavelength analysis to verify correction.

Employ Sensitivity analysis to assess robustness.

Example 3: Designing an Infinity-Corrected Microscope Objective

Microscope objectives require precise correction for

aberrations at high magnifications. Design steps: 1. Define

System Specifications: Magnification: 40x Numerical

Aperture (NA): 0.65 Wavelengths: 450 nm, 550 nm, 650 nm

2. Create Multi-element System: Multiple lens elements with aspherical surfaces to correct aberrations. Use glass

materials with varying dispersion properties. 3. Simulation

and Optimization: Use Zemax's Physical Optics Propagation tool for high-NA systems. Optimize for minimal spot size across the field. 4.
